

What can we scan using ReConfirm

For comprehensive coverage, we recommend activating ReConfirm on the top-level domain (e.g., demodata.com) instead of individual subdomains (e.g., blog.demodata.com). This approach allows you to monitor all related and underlying assets more effectively.

It operates at the DNS level to uncover assets across your external attack surface. ReConfirm continuously monitors and conducts payload-based tests on all discovered Internet-facing domains, subdomains, IPs, ports, and technologies. This process helps identify exposed files, misconfigurations, and the latest vulnerabilities, including zero-day threats.

Please read the [Understanding Scanning Results](#) for more in depth information.
